

In the claims:

SUB  
B1  
A1

1. (Amended) A method of sequencing DNA fragments comprising:  
placing a DNA sample within a buffer in a separation apparatus having  
a plurality of migration channels;  
applying an electric field across the separation apparatus to create a  
bias in the buffer such that the DNA sample migrates from one end of the apparatus to  
another end along a migration channel;  
separating the DNA sample into fragments along the migration channel  
within the buffer;  
detecting fluorescent light emitted from the fragments along the  
migration channel; and,  
generating a full image of the separation apparatus and the separated  
DNA fragments at a given time based on the detecting.

2. The method of claim 1 wherein the buffer is a gel.

3. The method of claim 1 wherein the buffer is a polymer  
solution.

A2

4. (Amended) The method of claim 1 wherein the separation apparatus  
comprises a plurality of capillary tubes forming the migration channels.

5. (Amended) The method of claim 1 wherein the separation apparatus  
comprises a set of glass plates with lithographically etched channels forming the  
migration channels.

6. The method of claim 1 wherein the detecting comprises  
detecting using a full-width array scanner.

7. The method of claim 1 wherein the detecting comprises  
detecting using an amorphous silicon two-dimensional image sensor array.

8. The method of claim 1 wherein the detecting comprises detecting at a first time and then repeating the detecting after DNA fragments migrate through the gel for an additional period of time.

---

9. (Amended) An apparatus for the sequencing of DNA comprising:  
a separation apparatus having a plurality of migration channels operative to receive a DNA sample and facilitate migration and separation into fragments of the DNA sample along a migration channel within the apparatus;  
a detector operative to detect light emitted from DNA fragments along the migration channels; and,  
an image processor operative to generate image data representing a full image of the separation apparatus and the DNA fragments at a given time.

---

10. (Amended) The apparatus of claim 9 wherein the separation apparatus comprises:  
a plurality of capillary tubes comprising the migration channels;  
a buffer; and,  
a means for providing an electric field to create a bias between ends of the capillary tubes.

---

11. The apparatus of claim 9 wherein the separation apparatus comprises:  
a stacked pair of lithographically etched glass plates;  
a buffer; and,  
a means for providing an electric field to create a bias between ends of the glass plates.

12. The apparatus of claim 9 wherein the detector is a full-width array scanner.

13. The apparatus of claim 9 wherein the detector is a large area two-dimensional amorphous silicon image sensor array.

---

14. (Amended) A system for sequencing DNA fragments comprising:

SUB  
B5  
004  
A4  
CME

means for placing a DNA sample within a buffer in a separation apparatus having a plurality of migration channels;

means for applying an electric field across the separation apparatus to create a bias in the buffer such that the DNA sample migrates from one end of the apparatus to another end along a migration channel;

means for separating the DNA sample into fragments along the migration channel within the buffer;

means for illuminating the DNA fragments;

means for detecting fluorescent light emitted from the illumination fragments along the migration channel; and

means for generating a full image of the separation apparatus and the separated DNA fragments at a given time based on the detecting.

---

15. The system of claim 14 wherein the detecting means comprises a full-width array scanner.

16. The system of claim 14 wherein the detecting means comprises an amorphous silicon two-dimensional image sensor array.

17. The system of claim 14 wherein the illumination means comprises a laser that illuminates perpendicular to the direction of migration of the DNA fragments.

18. The system of claim 14 wherein the illumination means comprises a laser that illuminates along the direction of migration of the DNA fragments.

19. The system of claim 14 wherein the illumination means comprises a light emitting diode bar.

20. The system of claim 14 wherein the illumination means comprises a laser attached to the rear of the detector.
